the pulmonary and bronchial circulations in congenital heart disease Bronchial hyperresponsiveness (or other combinations with airway or hyperreactivity) is a state characterised by easily triggered bronchospasm (contraction of the bronchioles or small airways).. Bronchial hyperresponsiveness can be assessed with a bronchial challenge test. This most often uses products like methacholine or histamine. These chemicals trigger bronchospasm in normal individuals as ...

the pulmonary and bronchial circulations in congenital heart disease x Primary graft dysfunction (PGD) is a major cause of morbidity and mortality after lung transplantation. Its incidence has decreased with optimization of lung preservation strategies. It remains, however, a major problem, particularly in patients with pulmonary fibrosis and pulmonary hypertension. 1 Its development is generally multifactorial and, thus, it is referred to as a syndrome.

the pulmonary and bronchial circulations in congenital heart disease x Large airway reconstruction is difficult and requires a flap which will mirror the tissue variety. The main challenge is to keep the reconstruction stable and prevent collapse. In this report, the authors present a laryngotracheal reconstruction with a buccal mucosa-prefabricated medial femoral condyle free flap, after chondroma excision in a one-step procedure.
